**QUESTION** Is rocuronium noninferior to succinylcholine for first-attempt endotracheal intubation success among patients undergoing rapid sequence intubation in an out-of-hospital emergency setting?

**CONCLUSION** This randomized trial did not demonstrate the noninferiority of rocuronium compared with succinylcholine with regard to first-attempt endotracheal intubation success.

### POPULATION

736 Men  
490 Women

Adults requiring  
out-of-hospital intubation

Mean age: 56 years

### LOCATIONS

17  
Emergency medical  
units in France

### INTERVENTION

1226 Patients analyzed

610

#### Rocuronium

1.2 mg/kg Rocuronium  
via IV bolus injection

616

#### Succinylcholine

1 mg/kg Succinylcholine  
via IV bolus injection

### PRIMARY OUTCOME

Intubation success rate in first attempt,  
with a noninferiority margin of 7%

### FINDINGS

#### First-attempt intubation success

#### Rocuronium

455 of 610 patients

#### Succinylcholine

489 of 616 patients

The between-group difference  
did not meet criteria for noninferiority:

**-4.8%** (1-sided 97.5% CI, -9% to ∞)

# Effect of Use of a Bougie vs Endotracheal Tube and Stylet on First-Attempt Intubation Success Among Patients With Difficult Airways Undergoing Emergency Intubation: A Randomized Clinical Trial

AIRWAY/ORIGINAL RESEARCH

## The Bougie and First-Pass Success in the Emergency Department

Brian Driver, MD\*; Kenneth Dodd, MD; Lauren R. Klein, MD; Ryan Buckley, MD; Aaron Robinson, MD; John W. McGill, MD; Robert F. Reardon, MD; Matthew E. Prekker, MD

\*Corresponding Author. E-mail: [briandriver@gmail.com](mailto:briandriver@gmail.com), Twitter: [@brian\\_driver](https://twitter.com/brian_driver).

**Study objective:** The bougie may improve first-pass intubation success in operating room patients. We seek to determine whether bougie use is associated with emergency department (ED) first-pass intubation success.

**Methods:** We studied consecutive adult ED intubations at an urban, academic medical center during 2013. Intubation events were identified by motion-activated video recording. We determined the association between bougie use and first-pass intubation success, adjusting for neuromuscular blockade, video laryngoscopy, abnormal airway anatomy, and whether the patient was placed in the sniffing position or the head was lifted off the bed during intubation.

**Results:** Intubation with a Macintosh blade was attempted in 543 cases; a bougie was used on the majority of initial attempts (80%; n=435). First-pass success was greater with than without bougie use (95% versus 86%; absolute difference 9% [95% confidence interval (CI) 2% to 16%]). The median first-attempt duration was higher with than without bougie (40 versus 27 seconds; difference 14 seconds [95% CI 11 to 16 seconds]). Bougie use was independently associated with greater first-pass success (adjusted odds ratio 2.83 [95% CI 1.35 to 5.92]).

**Conclusion:** Bougie was associated with increased first-pass intubation success. Bougie use may be helpful in ED intubation. [Ann Emerg Med. 2017;70:473-478.]

AIRWAY/SYSTEMATIC REVIEW/META-ANALYSIS

## Effect of Bougie Use on First-Attempt Success in Tracheal Intubations: A Systematic Review and Meta-Analysis

Rafael von Hellmann, MD; Natalia Fuhr, MD; Ian Ward A. Maia, MD; Danielle Gerberi, MLIS; Daniel Pedrollo, MD, MS; Fernanda Bellolio, MD, MS; Lucas Oliveira J. e Silva, MD, MS\*

\*Corresponding Author. E-mail: [lojesilva@gmail.com](mailto:lojesilva@gmail.com) or [lojsilva@hcpa.edu.br](mailto:lojsilva@hcpa.edu.br).

The use of a bougie, a flexible endotracheal tube introducer, has been proposed to optimize first-attempt success in emergency department intubations. We aimed to evaluate the available evidence on the association of bougie use in the first attempt and success in tracheal intubations. This was a systematic review and meta-analysis of studies that evaluated first-attempt success between adults intubated with a bougie versus without a bougie (usually with a stylet) in all settings. Manikin and cadaver studies were excluded. A medical librarian searched Ovid Cochrane Central, Ovid Embase, Ovid Medline, Scopus, and Web of Science for randomized controlled trials and comparative observational studies from inception to June 2023. Study selection and data extraction were done in duplicate by 2 independent reviewers. We conducted a meta-analysis with random-effects models, and we used GRADE to assess the certainty of evidence at the outcome level. We screened a total of 2,699 studies, and 133 were selected for full-text review. A total of 18 studies, including 12 randomized controlled trials, underwent quantitative analysis. In the meta-analysis of 18 studies (9,151 patients), bougie use was associated with increased first-attempt intubation success (pooled risk ratio [RR] 1.11, 95% confidence interval [CI] 1.06 to 1.17, low certainty evidence). Bougie use was associated with increased first-attempt success across all analyzed subgroups with similar effect estimates, including in emergency intubations (9 studies; 8,070 patients; RR 1.11, 95% CI 1.05 to 1.16, low certainty). The highest point estimate favoring the use of a bougie was in the subgroup of patients with Cormack-Lehane III or IV (5 studies, 585 patients, RR 1.60, 95% CI 1.40 to 1.84, moderate certainty). In this meta-analysis, the bougie as an aid in the first intubation attempt was associated with increased success. Despite the certainty of evidence being low, these data suggest that a bougie should probably be used first and not as a rescue device in emergency intubations. [Ann Emerg Med. 2023;■:1-13.]
